GOOD REASONS to choose the Oxi-Reactive- System for roller coating

1 Conventional, oxidatively drying oil dries very slowly

- Reduce the cycle time through the oil department from 2 days to 10 minutes. The parquet flooring can be packed directly.

2 Long drying times require a lot of space in trolleys

- Do without trolleys and use your production areas more effectively!

3 Much more natural than most UV oils

- According to Austrian standard C2380, the Oxi-reactive oil for roller coating is a natural oil with at least 90 % natural ingredients. That's even certified!

UV oils, by contrast, often only have a very small percentage of natural ingredients.

4 Oiled parquet flooring is often very sensitive

- Delight your customers with the outstanding resistance of the Oxi-reactive surface. It will save your customer time on maintenance and repair work!

5 Your surfacing department is too expensive

- Reduce the cost of surfacing by 40 % by using a modern oil system with UV activation.

What is your current manufacturing objective? What is your priority issue?

Does the cycle time need to be reduced, or should the oiled surfaces simply be more resistant?

**Give us a call!
Together we will find the best solution
for your production.**
